Lecture 1: Introduction

¹p.k.jimack@leeds.ac.uk

This lecture

Assignment Project Exam Help

This lecture we will cover:

- Materials available for this module.
- Assessments (3× coursework plus exam) with deadlines.
- How historical trends in computer architectures have lead to the current ubiquity of parallel machines.
- The three classes of parallel architecture we will look at.
- Module overview

Module administration

Lecture slides

- All lectures will be made available on Minerva at least 24 hours in advance of the timetabled slots

Worksheets

- **Formative**, i.e. not assessed.
- A new worksheet will appear on Minerva prior to lectures 2, 8 and 14 respectively.
- Specimen answers will appear on Minerva roughly 1 week after the corresponding lecture.

Computer resources

- All computer assignments will be undertaken using the Cloud
- Accounts have been created for you: **ONLY** use for work relating to **THIS** module
- Access details provided as part of worksheets/assignments

Other support

Assignment Project Exam Help

Discussion on Minerva

- There is a forum for each part of the module.
- Post your queries relating to lectures, worksheets, assessments, etc.
- Ensure everyone sees the same guidance.
- Check first your query has not already been answered.

<https://powcoder.com>

Labs

Add WeChat powcoder

- For you to practice coding exercises (worksheets) and courseworks.
- Please see Joint School for locations/times.

Assessments (summative)

Assignment Project Exam Help

Assessment is by both **coursework** and **exam**:

- 50% spread over 3 items of coursework.
- 50% in a closed book exam.

<https://powcoder.com>

Each coursework is **code-only** submissions *via* Minerva.

- **Please test your submissions on the cloud service – even if you develop and run on your own computer!**

Add WeChat powcoder

Each worksheet covers similar material to each coursework, so *attempting the current worksheet prior to the assignment will help you significantly* with the next coursework.

Coursework schedule and deadlines

Assignment Project Exam Help

Coursework	Weight	Release	Deadline
1	15%	15 th March	Tuesday 29 th March
2	20%	5 th April	Tuesday 19 th April
3	15%	19 th April	Tuesday 3 rd May

<https://powcoder.com>

Before attempting the courseworks you should familiarise yourself with the relevant material:

Add WeChat powcoder

Coursework	Up to and including
1	Lecture 6
2	Lecture 11
3	Lecture 16

Language

Assignment Project Exam Help

For this module we will use C.

- We will cover three different parallel libraries/API's, and the only languages that cover **all** of them are C/C++.
- Since our codes are short, we will just use C, not C++.
- Will provide starting codes in C for each coursework.
- Coursework submissions must be in C.

Add WeChat powcoder

If you have not programmed in C for a while you may like to revise *XJCO1711 Procedural Programming*.

We will mostly use **loops**, **conditionals**, **arrays** and **pointers**.

Books

For additional information on for parallel programming in general:

- **Parallel Programming**, *Wilkinson and Allen* (Pearson).
 - Old (2nd ed. 2005), covers CPU architectures but not GPU.
 - Many examples, though some only schematic.
 - Multiple copies in UoL libraries (1st and 2nd eds).
- **Structured Parallel Programming**, *McCool, Robison and Reinders* (Morgan-Kaufman, 2012).
 - Modern, focuses on patterns of parallel algorithm design.
 - Few code examples, mainly for shared memory systems.
 - eBook available *via* the library.

Books for specific architectures will also be mentioned when introduced. **You do not need to buy any of these books.**

Why this module?

Assignment Project Exam Help

- Almost all modern computers and devices fall into one of three classes of **parallel architecture**.
- Software must be **parallelised** to use these resources.
 - This is the job of the programmer i.e. **you**.
- Popular APIs/frameworks are constantly changing.
 - No point focusing on any one as it may not last.
- Need to develop **portable skills in parallel algorithm design** that can be applied to current **and future** APIs, frameworks and architectures.

<https://powcoder.com>

Add WeChat powcoder

¹With very few exceptions, e.g. feature phones *etc.*

Objectives and learning outcomes

Objectives: This module will introduce the fundamental skills and knowledge required to develop parallel computer software.

Learning outcomes: On successful completion of this module a student will have demonstrated the ability to:

- Recall key concepts of parallel software and hardware.
- Apply parallel design paradigms to serial algorithms.
- Evaluate and select appropriate parallel solutions for real world problems.
- Generalise parallel concepts to future hardware and software developments.

Skills outcomes: Programming, design, performance measurement, evaluation.

Syllabus

Assignment Project Exam Help

This module covers the following 3 topic areas:

- **Parallel programming design patterns:** Work pools, data parallelism, synchronisation, locks, MapReduce and atomic instructions.
- **Parallel computation models:** shared memory parallelism (SMP), distributed memory parallelism and general purpose graphics processing unit (GPGPU)
- **Common frameworks:** OpenMP, Message passing interface (MPI) and OpenCL.

<https://powcoder.com>

Add WeChat powcoder

Background and motivation

Early computers followed the so-called **von Neumann architecture** (1946).

- Based on Turing's **universal machine** (1936).
- Fundamentally **sequential**, i.e. processes a series of instructions.

Turing (top), von Neumann (bottom)
(from Wikipedia)

Moore's law

Assignment Project Exam Help

In 1965, Gordon Moore made the empirical observation that the number of transistors on a chip doubles every 18-24 months.

This is known as **Moore's law** and holds to this day.

<https://powcoder.com>

- Component cost *versus* no. of components.
- Projected 1970 data.
- **Exponential increase** of the most cost-effective number of components.

<http://www.startupinnovation.org/research/moores-law>

Processor speeds also used to follow Moore's law, but stopped around 15 years ago at $\approx 3.3\text{GHz}$ (ignoring overclocking).

Assignment Project Exam Help

<http://www.economist.com/technology-quarterly/2016-03-12/after-moores-law>

Limitations on clock speed

Increased frequencies result in greater leakage and greater power consumption¹.

$$P = \alpha C_L V^2 f$$

- P is the processor's power consumption.
- C_L is a load capacitance.
- V is the supply voltage.
- f is the frequency.

However, $V \propto f$, so $P \propto f^3$.

- **Rapid increase** that exceeds 100W for $f \approx 3.3\text{GHz}$.
- Unsustainable even with sophisticated cooling technology.

¹You don't need to learn this equation [which was taken from *Parallel Programming*, 2nd ed., Rauber and R nger (Springer, 2013)].

ILP: Instruction Level Parallelism

Chip designers have tried various **architectural improvements** to increase performance (*memory cache, speculative execution etc.*)

Assignment Project Exam Help

One is **pipelining**, where different stages of subsequent instructions are overlapped.

- Only one *fetch*, *decode* etc. at any given time.

This **instruction level parallelism** (ILP) is **limited** to around 10-20 instructions.

- We say it does not **scale**.

Multi-core CPUs (Lectures 2-7)

These architectural improvements did not require changes to code.

Assignment Project Exam Help

- Legacy sequential code **automatically** benefited.

Each improvement has **limitations** that have not been overcome.

Starting around 2005, chips for consumer machines have been **multi-core**, where each **core** has distinct control flows.

- For a few cores, can run applications simultaneously.

https://powcoder.com

Add WeChat powcoder

With new chips having many cores (6, 8, 12, 16, 24, 28) running one application per core is not feasible.

- **Single** applications need to use **multiple** cores.
- **Requires new program logic.**

Clusters / Supercomputers (Lectures 8-13)

Even before clock speeds plateaued, some applications used multiple machines.

- Scientific computing
- Weather forecasting.
- ...

PFlops = **petaflops** = 10^{15}
floating point operations per second;

EFlops = **exaflops** = 10^{18}
floating point operations per second.

<https://www.top500.org/statistics/perfdevel>

GPGPU (Lectures 14-19)

Assignment Project Exam Help

In the mid-1990s, the rise of graphical applications (especially games) drove the development of **graphics accelerators**:

- Chips specialised to computations for 2D/3D graphics.

In 2006 Nvidia released the first graphics card capable of **general purpose calculations** using its CUDA architecture.

- GPGPU = General Purpose Graphics Processing Unit.

- Now supported by most manufacturers via OpenCL.

Add WeChat powecoder

Suitable for other applications **including machine learning**.

- GPUs are part of the **deep learning** revolution.
- Now have dedicated **neural processing units** (NPUs).

Precedent from nature

Assignment Project Exam Help

Arguably the most complex system known is the human brain

If regarded as a computer, it would be **massively parallel**:

- Synapse speeds are about 5 ns, so the clock speed would be less than 1kHz.
- We have about 10^{11} neurons, each connected to 10^4 others.
- The current fastest supercomputer has $\approx 10^7$ cores.

<http://scitechconnect.elsevier.com>

Parallel *versus* concurrent

Two or more applications run **concurrently** if they actually execute 'in the same time frame.'

- *i.e.* a **multi-tasking OS**, where processes are swapped in and out without the user noticing.
- Possible on a single-core architecture.

Whereas **parallel** applications actually perform calculations **simultaneously** on a parallel architecture.

Parallelism implies concurrency, but **not** *vice versa*, *i.e.*

Parallel \subset Concurrent

Shared *versus* distributed memory

Shared memory

- All cores can 'see' whole of main memory.
- e.g. multi-core CPU.

Distributed memory

- Cores only see a fraction of the total memory.
- e.g. cluster, supercomputer.

Computation *versus* communication

Assignment Project Exam Help

Moving data to and from the cores also affects performance.

Fast: **Registers** for each processing unit.

- **Cache** memory to registers.
- **Main** memory to cache memory.
- Fast communication in **high-performance clusters** (e.g. InfiniBand, Gigabit Ethernet).
- **Local area** network communication (e.g. Ethernet).
- **File I/O**.

Slow: **Wide area** network communication (e.g. the internet).

Flynn's taxonomy¹

Characterises parallel architectures by **data** and **control** flows.

Acronym	Instruction/data streams	Examples
SISD	<u>S</u> ingle <u>I</u> nstruction, <u>S</u> ingle <u>D</u> ata	Single-core CPU
SIMD	<u>S</u> ingle <u>I</u> nstruction, <u>M</u> ultiple <u>D</u> ata	GPU (<i>also SIMT</i> ; c.f. <i>Lecture 14</i>)
MIMD	<u>M</u> ultiple <u>I</u> nstruction, <u>M</u> ultiple <u>D</u> ata	Multi-core CPU; cluster, supercomputer
MISD	<u>M</u> ultiple <u>I</u> nstruction, <u>S</u> ingle <u>D</u> ata	Specialist hardware only

¹Flynn, *IEEE Transactions on Computers* **21**, 948 (1972).

Module overview

Assignment Project Exam Help

Lectures	Content
1	Introduction
2-7	Shared memory parallelism C with OpenMP Worksheet 1 and Coursework 1
8-13	Distributed memory parallelism MPI-C Worksheet 2 and Coursework 2
14-19	General purpose GPU OpenCL (<i>a C-based language</i>) Worksheet 3 and Coursework 3
20	Module review

Next lecture

Assignment Project Exam Help

Next lecture is the first of six on **shared memory parallelism**:

- Relevant to **multi-core architectures**, such as on modern laptops, desktops, tablets and phones
- Overview typical hardware **architecture**, including **memory cache**.
- Look at some language and library support.
- How to install and run OpenMP programs.
