Overview Multi-threaded vector addition Nested loops in parallel Summary and next lecture

# Assignment Project Exam Help XJC03221 Parallel Computation

https://powcoder.com

Peter Jimack

### Add We Chat powcoder

Lecture 3: Data parallel problems

### Previous lectures

## Assignment Project Exam Help

In the last lecture we started looking at **shared memory** parallelism (SMP):

- · https://pawcoder.com
- Separate processing units (cores) share some levels of memory cache.
- · Addawkerphatmpowsender
- Widely-implemented standard: **OpenMP**.

### Today's lecture

## Assignment-Project-Exam Help

- Examples of a data parallel problems, where the same operation is applied to multiple data elements.
- · https://powcoder.com
- Multi-threading solution employs a fork-join pattern.
- How to parallelise nested loops.
- Parle code is deterministic.

<sup>&</sup>lt;sup>1</sup>McCool et al., Structured parallel programming (Morgan-Kaufman, 2012).

#### Vector addition

## rector a can be the part of is a carra Eth aumbers: Help

If two vectors **a** and **b** are the same size, they can be added to

## Add We Chat pow coder $c = (c_1, c_2, c_3, \ldots, c_n)$

Or:

$$c_i = a_i + b_i$$
 ,  $i = 1 \dots n$ .

### Serial vector addition

Code on Minerva: vectorAddition\_serial.c

## Assignment Project Exam Help

Note that indices usually start at 0 for most languages, but 1 for the usual mathematical notation (also FORTRAN, MATLAB).

### Vector addition in parallel Code on Minerva: vectorAddition\_parallel.c

A sais a sassant Dustin of Essent I

```
Assignment Project Exam Help
```

```
https://powcoder.com
6
      // Initialise a[n] and b[n]
7
8
   int A dd pawe Chat powcoder
9
    c[i] = a[i] + b[i];
12
14
   return 0;
15
```

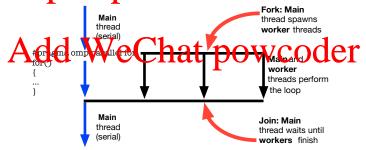

This only parallelises this one loop, not any later ones!

### Fork-and-join

## A SSI galineaus Project Exam Help

- Each thread computes **part** of the loop.
- The extra threads are **destroyed** at the end of the loop.

This https://prowdeder.com

### Example: Four threads in total

Pseudocode for the main thread:

```
ssignment Project Exam Help
```

```
// REACHES #pragma omp parallel for
  // FORK: Create three new threads.
 work https://powcoder.com
9
  // Perform 1/4 of the total loop.
 for Add We Chat powcoder
  // JOIN: Wait for other threads to finish.
  worker1.join();
  worker2.join();
  worker3.join();
18
  // Continue in serial after the loop
```

#### Worker thread 1:

```
Assignment Project Exam Help
```

```
Worker thread 2:
// CREATE DS DIN / powcoder.com
2 // Perform third 1/4 of loop.
3 for ( i=n/2; i x3*n/4; i++ ) c[i] = a[i] + b[i];
4 // FINISH ('join')

Worker thread 3 WeChat powcoder
```

```
1 // CREATED BY MAIN ('fork')
2 // Perform final 1/4 of loop.
3 for( i=3*n/4; i<n; i++ ) c[i] = a[i] + b[i];
4 // FINISH ('join')</pre>
```

#### Notes

## A SThe four thread are not pipe executed on after the other Help is concurrently, hopefully on separate cores, i.e. in parallel.

• Cannot be understood in terms of serial programming blebs://powcoder.com

Each thread performs the **same** operations on **different** data.

• Would be Silve in Frynin's taxonomy except this is er impremented in software on a MI MD device.

Have assumed n is divisible by the number of threads for clarity.

• Generalising to arbitrary *n* is not difficult, but obscures the parallel aspects.

### #pragma omp parallel for

## Assignment Project Exam Help

The total loop range was evenly divided between all threads.

- Happens as soon as #pragma omp parallel for reached.
   Hattipsount/(D. Qo)Vacgo Austre Contact the start of the loop.
- The start, end and stride must be constant.
- Added Wetchat powcoder
- Cannot apply to 'while...do' or 'do... while' loops

### Data parallel and embarrassingly parallel

## Assignment Project Exam Help

- Array elements distributed evenly over the threads.
- Same operation performed on all elements.
   Subtable Since Since

- Easy to get working correctly in parallel.
- May still be a challenge to achieve good parallel performance.

### Mandelbrot set generator

Code on Minerva: Mandelbrot.c, makefile

## Assignment interso jeert in Examins the pused to be used as a benchmark for processor speeds:

two dimensional, restew Coder. com double loop.

Colour of each pixel calculated indvivermently a of all other pixels.

 Each colour calculation requires many floating point operations.

### Code snippet

```
As The part of the code that Dterests us here Exam Help
```

Note the 1-loop is nested inside the 1-loop. We Chat powcoder

The graphical output is performed in OpenGL/GLFW. Since including and linking is different between Linux and Macs, a simple makefile has been provided.

#### What setPixelColour does

## A SSI genment Project Exam Help

- Each **pixel** i, j is converted to **floating point numbers**  $c_x$ ,  $c_y$ , both in the range -2 to 2.
- https://poweoder.com
- The following iteration<sup>1</sup> is performed until  $z_x^2 + z_y^2 \ge 4$ , or a maximum number of iterations maxIters is reached:

### Add W.e.C.hat.powcoder

The colour is selected based on the number of iterations.

<sup>&</sup>lt;sup>1</sup>More concisely represented as **complex numbers** c and z [with e.g.  $z_x = \Re(z)$ ], then the iteration is just  $z \to z^2 + c$ .

### Parallel Mandelbrot: First attempt

## Assignment Project Exam Help

```
for( j=0; j<numPixels_y; j++ )
#pragma omp parallel for
for( i=0; i<numPixels_x; i++ )
{
    tips:/powcoder.com
}</pre>
```

This works, but may be slower than serial (check on your system).

Add WeChat powcoder

Multiple possibilities for this:

- The **fork-join** is **inside** the j-loop, so threads are created and destroyed numPixels\_y times, which incurs an **overhead**.
- This problem suffers from poor load balancing; see later.

### Parallel Mandelbrot: Second attempt

## Assignmenter of other of xannekerelp and a single join event.

## This Add but Chat powcoder

- A distorted image results.
- The distortion is different each time the program is executed.

The same variable i for the inner loop counter is being updated by all threads:

Assignment. Project Exam Help

• Therefore other threads will skip at least one pixel.

https://powcoder.com

Add Wechat powcoder

### Parallel Mandelbrot: Third attempt

Make the inner loop variable i **private** to each thread:

Assignment Project Exam Help

```
for ( j=0; j<numPixels_y; j++ )

{
    int i;
    for hit ps.../powcoder.com
    setPixelColour( f, j );
    }
}
```

... or Atdel stweets hat powcoder

```
#pragma omp parallel for
for( int j=0; j<numPixels_y; j++ )
for( int i=0; i<numPixels_x; i++ )
{
    setPixelColour( i, j );
}</pre>
```

9

### The private clause

## Asstignment Project Exam Help

- Creates a copy of i for each thread.
- · Mtodrid e Coltrat e powe oct et

The code now works ... but is no faster for more than 2 threads!

• The primary overhead is poor **load balancing**. We will look at this next lecture briefly, and detail in Lecture 13.

#### Determinism and non-determinism

Assignment Projection Einelp

https://powcoder.com

The pixels plotted depend on the order in which threads update

the shared variable i, which depends on the thread **scheduler**.

- Will be influenced by factors outside our control.
- *e.g.* the various **background tasks** that every OS must run.

## Our serial code was deterministic, i.e. produced the same results Assigniment Project Exam Help

By contrast, our (incorrect) parallel code was non-deterministic.

## Often this ignit result of an error, but der come useful:

- Some algorithms, often in science and engineering, do not care about non-deterministic errors as long as they are small.
- overheads and performance loss.

However, for this module we will try to develop parallel algorithms whose results match that of the serial equivalent.

### Summary and next lecture

### ssignment Project Exam Help Today We have looked at data parallel problems or maps, where the same operation is applied to multiple data members.

Distribute data/evenly across threads.

Sometimes referred to as embarrassingly para

Next week we will start looking at more complex problems for which the calculations on different threads are **not** independent. Add WeChat powcoder

Before then, we need to learn the vocabulary of parallel theory, which is the topic of next lecture.
